

**Treating sickle
cell disease:
Is hydroxyurea
right for your
child?**

What is sickle cell disease?

Sickle cell disease changes the shape and texture of hemoglobin, which is a protein in red blood cells. People with sickle cell disease have hemoglobin that makes red blood cells a different shape:

Normal Hemoglobin A makes red blood cells round and soft

Sickle cell disease Hemoglobin S makes red blood cells hard, sticky, and banana or sickle-shaped

The banana-shape of sickle cells block blood flow, which can cause:

- Pain
- Damage to organs, muscles, and tissues
- Sticky blood and damage to blood vessels due to:
 - Too many platelets (cells that help us stop bleeding when we get hurt)
 - Too many white blood cells (cells that protect us against infections)

3

The **Pacific Sickle Cell Regional Collaborative** works to ensure that people with sickle cell disease receive quality care, no matter where they live or seek care.

Funding for this brochure was provided, in part, by grant number U1EMC27862 from the Health Resources and Services Administration Sickle Cell Disease Treatment Demonstration Program to the Pacific Sickle Cell Regional Collaborative.

What is hydroxyurea (HU)?

Hydroxyurea (HU) is a medicine that treats sickle cell disease. It can't cure your child of sickle cell disease. But it can help your child feel better if they take it every day and can help them stay healthy as they get older.

Research shows people who take Hydroxyurea:

- Live longer
- Have less pain
- Need fewer blood transfusions and hospital stays
- Have fewer cases of acute chest syndrome
- Have less damage to their brain, lungs, kidneys, and spleen

What does it do?

HU helps red blood cells travel easily through the body.

- Helps red blood cells stay round and soft
- Lowers platelets and white blood cells to normal levels

How does it work?

HU helps red blood cells make more of Hemoglobin F. This type of hemoglobin lowers the chances that red blood cells will change into the banana or sickle shape.

Who is it for?

It's for people of all ages who have sickle cell disease:

- It helps babies and young children avoid health problems due to sickle cell disease
- It helps children and adults feel better, especially if they've had:
 - Severe pain
 - Severe anemia (A low number of red blood cells)
 - Several cases of acute chest syndrome
 - Problems with their internal organs

Don't take HU if you're pregnant or planning to get pregnant. Doctors don't know how HU might affect an unborn baby.

Is hydroxyurea safe?

Yes. HU is safe when a doctor who sees lots of patients with sickle cell disease gives it to your child and checks their blood levels often.

What are the side effects?

There have been no serious side effects in people with sickle cell disease who have taken HU. The HU dose for sickle cell disease does not cause hair loss, throwing up, weakness, or loss of appetite.

Short-term side effects:

- Your child may get a stomach ache. To prevent this, have them take HU during a meal.
- Boys may make less sperm and sperm that move slowly. This usually returns to normal when they stop taking HU.

Long-term side effects:

- Doctors aren't yet sure what the long-term side effects are. In the past, doctors thought that people who take HU might be more likely to get cancer. But they haven't found this to be true, even in people taking HU for more than 20 years.

How does treatment work?

Your child will take HU by mouth once a day. They can drink it as a liquid or swallow it as a pill.

Your child needs to take HU every single day.

This is because their body makes new sickle cells every day, so their daily amount of HU helps their body prevent sickle cells.

It may take months before they feel better because it takes that long to get the right amount of HU in their body. But they should still take it every day.

Deciding on the HU dose

For the first several months, the doctor will give your child a small amount of HU and check their blood levels monthly:

- If their levels of white blood cells and platelets stay normal, the doctor will slowly give your child more HU over many months
- If their levels of white blood cells or platelets fall too low, the doctor will give your child less HU

Your child will have checkups

- After several months without problems, your child will only need to see their doctor for checkups and blood work every two months. They will see the doctor more often if they have a problem.

How can I learn more?

6

Call your child's sickle cell doctor or nurse

They can answer any of your questions about HU.

Doctor's/Nurse's Names: _____

Phone Numbers: _____

Call your health insurance plan

Most health insurance plans cover HU. Check with your plan to find out if yours does.
